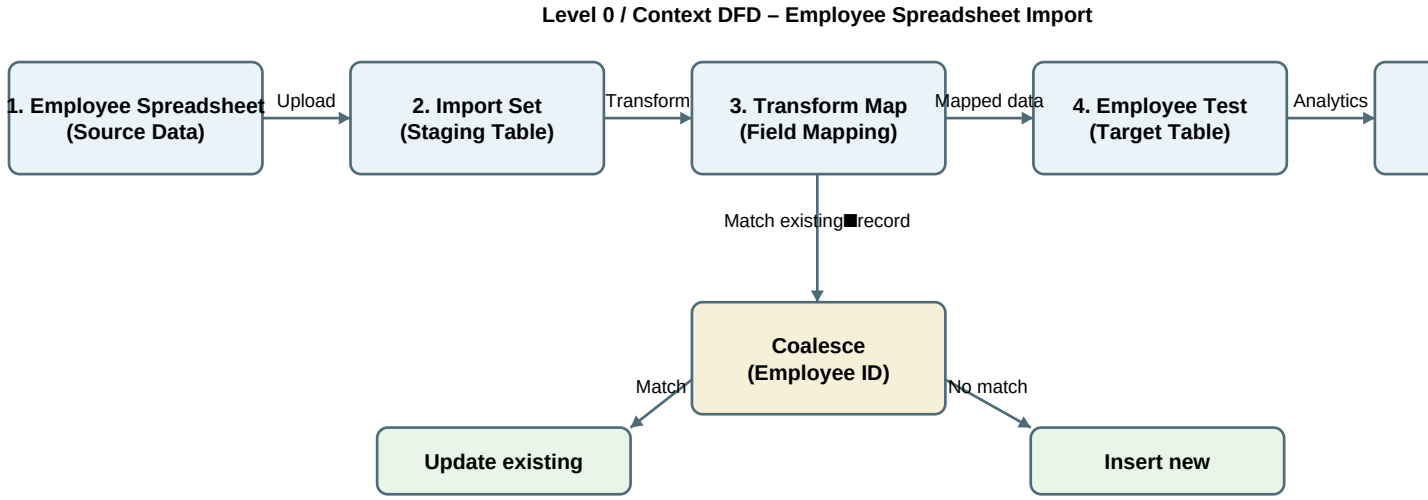
Project Design Phase-II

Data Flow Diagram & User Stories

Date	02 October 2026
Team ID	SWTID-2026-9088
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

Data Flow Diagram

The DFD shows how employee data moves from the spreadsheet source into the ServiceNow Import Set, through the Transform Map, into the Employee Test target table, and finally into reports and the dashboard. Coalesce uses the Employee ID to determine whether an existing record should be updated or a new record inserted.



DFD Flow Summary

Step	Data Flow
1	Employee spreadsheet provides source employee data.
2	The spreadsheet is loaded into the Employee Import / Import Set staging table.
3	The Transform Map maps source fields to Employee Test fields.
4	Coalesce checks Employee ID and supports update/insert behavior.
5	Transformed Employee Test records are used for reports and the Employee Analytics Dashboard.

User Stories

The following user stories are derived from the documented workflow for importing employee spreadsheet data, transforming it into the target table, preventing duplicates, validating results, and viewing analytics.

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance Criteria	Priority	Release
ServiceNow Administrator	Prepare Source Data	USN-1	As an administrator, I can prepare an employee spreadsheet with the required employee fields.	The spreadsheet contains the required source columns and valid employee data.	High	Release-1
ServiceNow Administrator	Import Employee Data	USN-2	As an administrator, I can upload the spreadsheet into the Employee Import / Import Set table.	The import completes and source rows are available in the staging table.	High	Release-1
ServiceNow Administrator	Transform Employee Data	USN-3	As an administrator, I can transform imported data into the Employee Test table using a Transform Map.	Source fields are correctly mapped to the corresponding target fields and records are created/updated.	High	Release-1
ServiceNow Administrator	Prevent Duplicates	USN-4	As an administrator, I can use Employee ID as a Coalesce field so repeated imports do not create duplicate employee records.	Existing Employee IDs update the matching record; new Employee IDs create new records.	High	Release-1
ServiceNow Administrator	Validate Import	USN-5	As an administrator, I can review transform results and verify inserted and updated employee records.	The transform result and target records can be checked for successful data migration.	High	Release-1
ServiceNow User	Employee Analytics	USN-6	As a user, I can view employee reports by department, location, and employee list.	The reports display the imported Employee Test data in the configured report formats.	Medium	Release-2
ServiceNow User	Dashboard	USN-7	As a user, I can view the Employee Analytics Dashboard containing the configured reports.	The dashboard loads the employee reports and provides a centralized view of employee information.	Medium	Release-2

Acceptance Summary

The user stories cover the complete project flow: source spreadsheet preparation, Import Set loading, Transform Map field mapping, Coalesce-based duplicate control, validation of transform results, reports, and the Employee Analytics Dashboard.

Note: The uploaded template provides the DFD and user-story structure; the project-specific flow and stories above are based on the documented Import Data using Transform Maps (Spreadsheet) implementation.
