Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	02 October 2026
Team ID	SWTID-2026-9088
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

Functional Requirements

The following functional requirements describe the required behavior of the ServiceNow employee-data import solution documented in the project. They cover spreadsheet preparation, data loading, transformation, duplicate handling, validation, reporting, and dashboard visibility.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Prepare Employee Source Data	Create and use a structured spreadsheet containing the employee data required for import.
FR-2	Load Employee Import Data	Load the spreadsheet into the Employee Import Import Set table as the staging area for source records.
FR-3	Transform Employee Data	Create and execute a Transform Map to map source fields from Employee Import to the Employee Test target table.
FR-4	Maintain Data Integrity	Use Employee ID as a Coalesce field so matching records are updated rather than creating duplicate employee records.
FR-5	Validate Transformation Results	Verify transformed Employee Test records and review insert/update results after the transformation.
FR-6	Generate Employee Reports	Create Employees by Department, Employees by Location, and Employee List Report using Employee Test data.
FR-7	Provide Employee Dashboard	Add the configured employee reports to the Employee Analytics Dashboard for centralized viewing.

Non-functional Requirements

The non-functional requirements describe quality expectations for the implemented ServiceNow solution. They are aligned with the project workflow and the requirement-template categories.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The import workflow should be understandable and manageable through the ServiceNow interface, including clear navigation for loading, transforming, and validating data.
NFR-2	Security	Employee data should be accessed and managed through authorized ServiceNow users and platform access controls. Credentials should not be stored in the project documentation.
NFR-3	Reliability	Repeated imports should preserve data integrity by correctly applying field mappings and Coalesce behavior for existing Employee IDs.
NFR-4	Performance	The solution should support efficient bulk employee-data loading and transformation through ServiceNow Import Sets and Transform Maps rather than manual record-by-record entry.
NFR-5	Availability	The import, target table, reports, and dashboard are available when the configured ServiceNow instance is available and the user has the required access.
NFR-6	Scalability	The Import Set and Transform Map approach should support additional employee records and repeated spreadsheet imports without requiring individual manual record creation.

Requirements Summary

Together, the functional and non-functional requirements define an end-to-end ServiceNow employee-data migration solution: source spreadsheet → Import Set → Transform Map → Employee Test → validation → reports and Employee Analytics Dashboard, with Coalesce supporting duplicate prevention during repeated imports.

Source basis: The functional requirements are derived from the supplied project implementation document and its documented phases. The uploaded template itself specifies the FR/NFR structure and the standard quality categories Usability, Security, Reliability, Performance, Availability, and Scalability.
