Project Design Phase

Problem – Solution Fit Template

Date	02 October 2026
Team ID	SWTID-2026-9088
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	2 Marks

Problem–Solution Fit identifies the customer problem and checks whether the proposed solution addresses that problem. The canvas below follows the sections shown in the supplied template and applies them to the employee spreadsheet import workflow.

1. CUSTOMER SEGMENT

ServiceNow administrators and employee-data managers responsible for importing and maintaining employee records.

2. CUSTOMER CONSTRAINTS

Employee data is received in spreadsheet form; manual entry takes effort; repeated imports can create duplicate records; field mapping must be accurate.

3. AVAILABLE SOLUTION

ServiceNow Import Sets, Transform Maps, Coalesce, the Employee Test custom table, reports, and the Employee Analytics Dashboard.

4. JOBS-TO-BE-DONE / PROBLEMS

Import employee spreadsheet data, map fields correctly, transform records, update existing employees, add new employees, validate results, and view employee analytics.

5. PROBLEM ROOT CAUSE

Spreadsheet data must be migrated into ServiceNow in a structured way. Without controlled mapping and record matching, manual work and duplicate/inconsistent records can occur.

6. BEHAVIORS

The user prepares a spreadsheet, uploads it through Load Data, creates/uses an Import Set and Transform Map, runs the transform, checks results, and reviews reports/dashboard.

7. TRIGGERS

A new or updated employee spreadsheet is received and needs to be migrated into ServiceNow or existing employee information needs to be refreshed.

8. YOUR SOLUTION

Use an end-to-end Import Set and Transform Map workflow. Map source fields to Employee Test, use Employee ID as Coalesce, transform the data, validate results, and expose the data through reports/dashboard.

9. CHANNELS OF ACQUISITION

Primary input channel: Excel/XLSX spreadsheet prepared by the user. Primary application channel: ServiceNow web interface for loading, transforming, validating, reporting, and dashboard access.

10. OUTCOMES BEFORE / AFTER

Before: Spreadsheet data requires migration and manual handling can be time-consuming.

After: Data is staged, mapped, transformed, matched through Coalesce, stored in Employee Test, and presented through reports/dashboard.

11. METRICS

Import/transform completion; number of employee records processed; inserted versus updated records; duplicate prevention through Coalesce; report and dashboard availability.

FIT SUMMARY

The solution directly addresses the core need for structured employee-data migration by combining staging, field mapping, transformation, duplicate prevention, validation, and analytics.

Project alignment: The supplied project documentation describes the spreadsheet as the source, the Import Set as the staging area, the Transform Map as the mapping/transformation mechanism, Employee Test as the target table, Coalesce for duplicate prevention, and reports/dashboard for analytics.
