Project Design Phase

Proposed Solution Template

Date	02 October 2026
Team ID	SWTID-2026-9088
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	2 Marks

The proposed solution below follows the six parameters specified in the uploaded Proposed Solution Template and is tailored to the documented ServiceNow employee spreadsheet import project.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Employee information received in spreadsheet format needs to be imported into ServiceNow accurately and efficiently. The process must support correct field mapping, transformation, validation, updating existing employee records, and preventing duplicate records during repeated imports.
2	Idea / Solution description	Implement a ServiceNow Import Set and Transform Map workflow. Load the spreadsheet into the Employee Import staging table, map the source fields to the Employee Test target table, use Employee ID as the Coalesce field, transform the data, validate the results, and provide employee reports and an Employee Analytics Dashboard.
3	Novelty / Uniqueness	The solution combines spreadsheet staging, configurable field mapping, transformation, Coalesce-based record matching, validation, and analytics in one repeatable ServiceNow workflow. Re-imported employee data can update matching records instead of creating unnecessary duplicates.
4	Social Impact / Customer Satisfaction	The solution reduces repetitive manual data entry and improves the consistency and reliability of employee records. Administrators can validate imported information more easily, while users can access organized employee information through reports and the dashboard.
5	Business Model (Revenue Model)	The project is an internal ServiceNow data-management solution rather than a standalone commercial product. No separate revenue model is specified in the supplied project documentation. Its value is operational efficiency, reduced manual effort, and improved data quality.
6	Scalability of the Solution	The Import Set and Transform Map approach can support additional employee records and repeated spreadsheet imports without manually creating each record. Coalesce supports existing-record matching, while the target table, reports, and dashboard can continue to handle the growing employee dataset within the configured ServiceNow instance.

Source alignment: The six parameters above are taken directly from the uploaded Proposed Solution Template. The project-specific descriptions are based on the documented Import Data using Transform Maps (Spreadsheet) workflow.
