Project Documentation

Functional / Full Stack Documentation Format

Date	02 October 2026
Team ID	SWTID-2026-9088
Project Title	Import Data using Transform Maps (Spreadsheet)
Project Version	1.0

1. Introduction

Project Title: Import Data using Transform Maps (Spreadsheet)
Team Members: To be filled from the project team record. No team-member names were provided in the supplied project materials, so none are invented here.

2. Project Overview

Purpose: The project provides a structured ServiceNow process for importing employee information from a spreadsheet into the Employee Test target table. It uses an Import Set for staging, a Transform Map for field mapping and transformation, and Coalesce using Employee ID for matching existing records during imports.

Key Features: Employee spreadsheet import; Employee Import staging; Transform Map field mapping; Employee Test target records; Coalesce-based record matching; validation of transformed records; Employees by Department, Employees by Location and Employee List reports; Employee Analytics Dashboard.

3. Architecture

The supplied template describes a React/Node.js/MongoDB architecture, but that technology stack does not match this project. For this ServiceNow project, the architecture is therefore documented using the actual platform components shown in the implementation evidence.

Layer	Project Implementation
User Interface	ServiceNow web interface used by the administrator to load data, run transformations, review records, reports and dashboard.
Data Input	Employee spreadsheet (XLSX) containing Employee ID, Name, Email, Department and Location.
Staging	Employee Import / Import Set table receives source spreadsheet rows.
Transformation	Transform Map maps source fields to the Employee Test target table.
Data Integrity	Coalesce uses Employee ID to identify matching records during repeated imports.
Database / Target	Employee Test custom table stores transformed employee records.
Analytics	ServiceNow reports and Employee Analytics Dashboard present the imported data.

4. Setup Instructions

Prerequisites: Access to the configured ServiceNow instance, appropriate ServiceNow permissions, and the employee spreadsheet used as the source data.
Setup flow: Prepare the spreadsheet → create/verify Employee Import staging table → create/verify Employee Test target table → configure Transform Map and field mappings → configure Employee ID as Coalesce where applicable → load data → run transform → validate records → create/view reports and dashboard.

5. Folder Structure

The supplied documentation template expects client/server folders for a MERN application. This project is implemented inside the ServiceNow platform, so a source-code folder structure is not applicable. The equivalent logical structure is: **Employee Spreadsheet** → **Employee Import** → **Transform Map** → **Employee Test** → **Reports** → **Dashboard**.

6. Running the Application

No npm start commands are required for this ServiceNow project. The application is accessed through the configured ServiceNow web instance. The administrator performs the import and transformation operations through the ServiceNow interface.

7. API Documentation

No custom backend API endpoints are documented or demonstrated for this project. The implementation uses native ServiceNow Import Set, Transform Map, table, reporting, and dashboard functionality.

8. Authentication

Authentication is provided by the ServiceNow instance. The project documentation does not specify a custom authentication/token/session implementation, so no unsupported custom authentication mechanism is added here.

9. User Interface

The implementation video provides visual evidence of the main ServiceNow interfaces used by the project. Selected screenshots are included below.

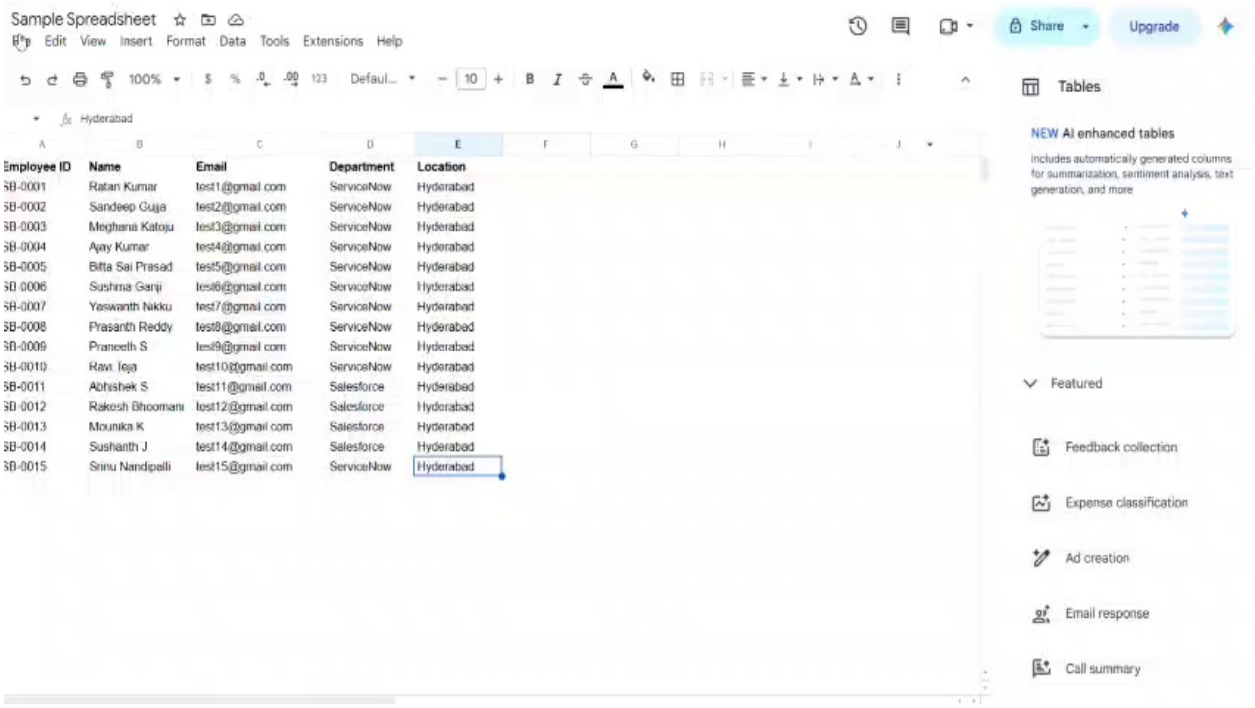

Figure 1. Employee spreadsheet used as the source data.

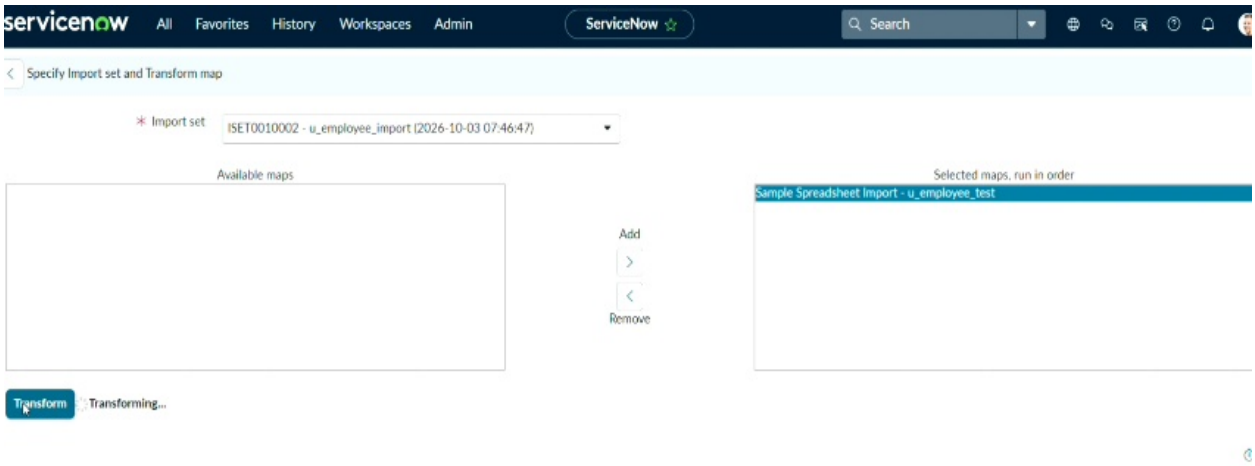

Figure 2. ServiceNow Import Set and Transform Map selection before transformation.

10. Testing

Testing was performed through the project UAT workflow. The implementation video demonstrates positive functional scenarios including source-data verification, transformation execution, target-record verification, location reporting, and dashboard verification. The UAT document records the corresponding test cases and actual results.

Test Area	Observed Result
Source spreadsheet	Employee source fields are populated and visible.
Transform Map	Import Set and Transform Map are selected and the transformation is executed.
Target records	Employee Test records are visible after transformation; the video shows 17 records at the demonstrated stage.
Location report	Hyderabad = 16 and Chennai = 1 are shown in the demonstrated report.
Department dashboard	ServiceNow = 11, Salesforce = 4 and Aiml = 2 are shown in the demonstrated dashboard.

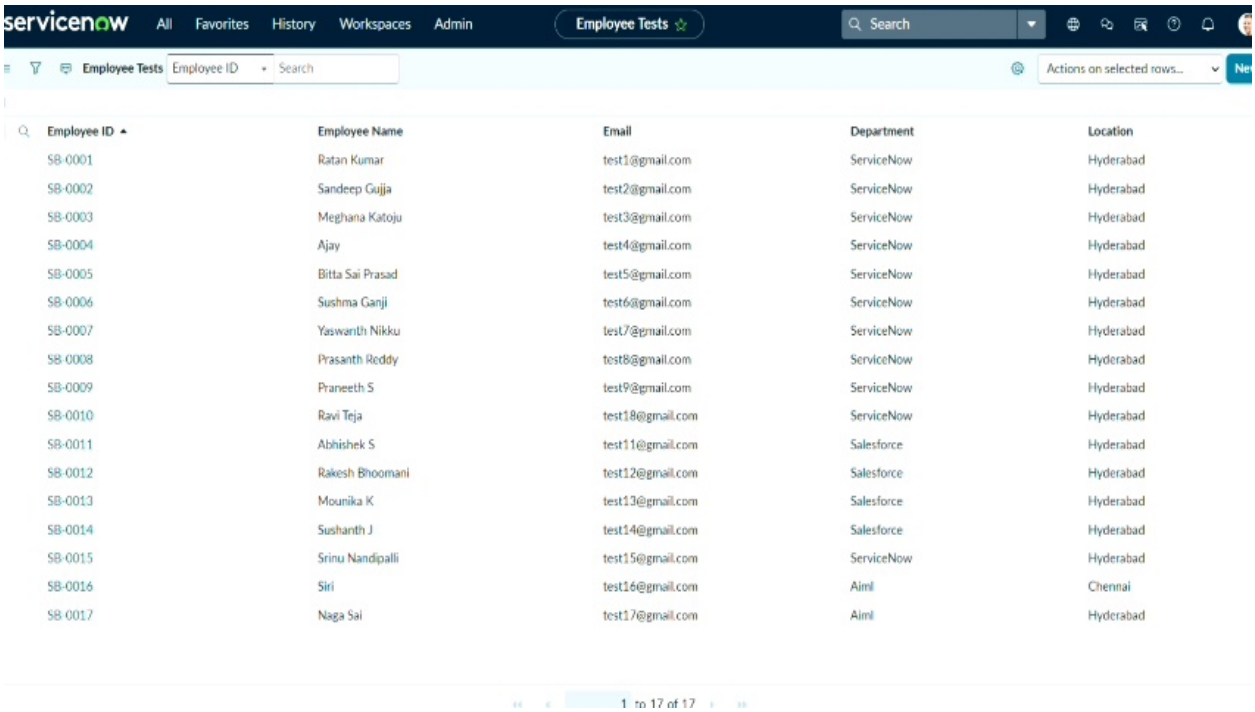

Figure 3. Employee Test target records after transformation.

11. Screenshots or Demo

The implementation video is the primary demo evidence for the project. The screenshots below highlight the reporting and dashboard portions of the demonstrated workflow.

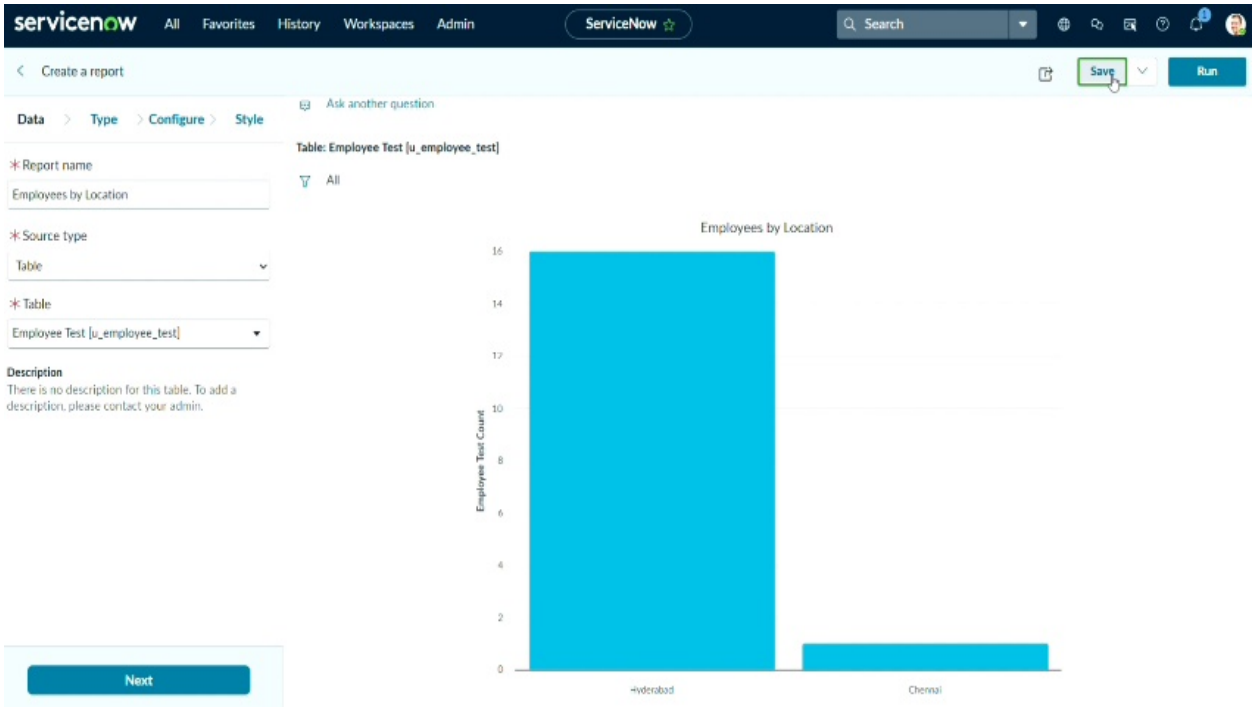

Figure 4. Employees by Location report shown in the implementation.

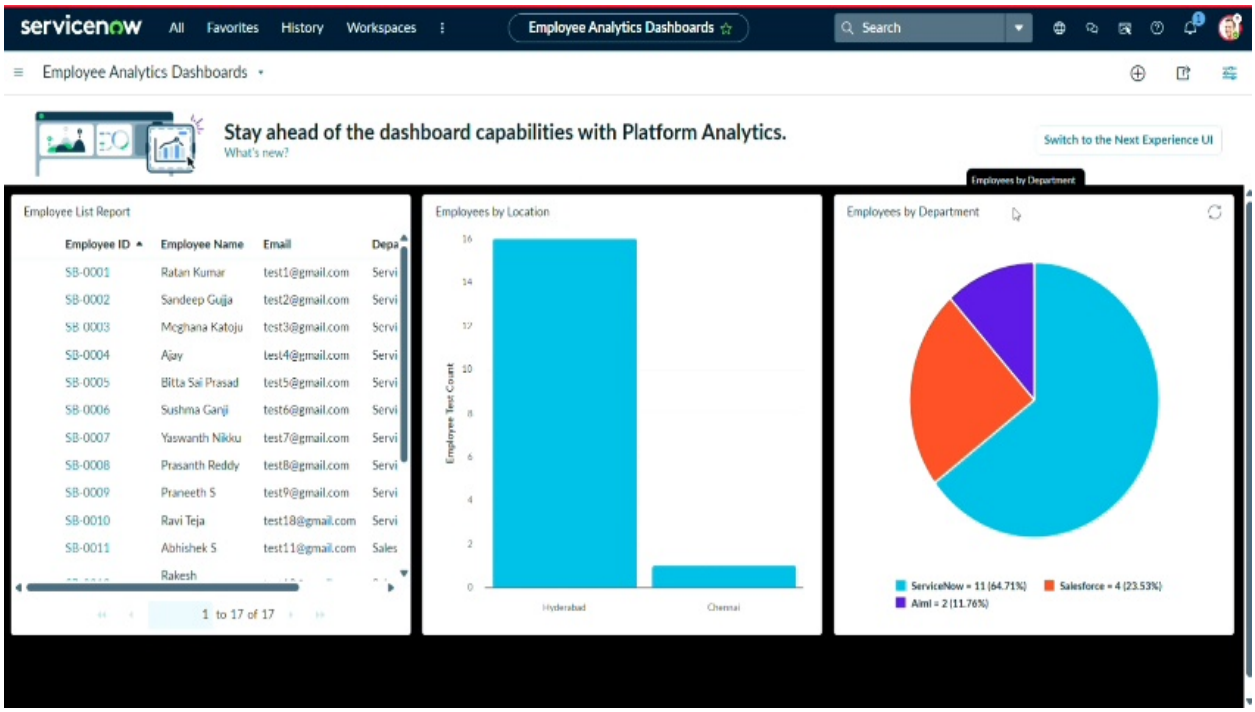

Figure 5. Employee Analytics Dashboard with employee, location and department views.

12. Known Issues

No functional defect was visibly demonstrated in the submitted implementation video. However, the video does not independently prove every possible negative or edge-case scenario, including a failed import or a repeated-import update case. Such scenarios should be tested separately if required for final acceptance.

13. Future Enhancements

Potential enhancements include stronger import validation, clearer error reporting for rejected rows, additional duplicate/edge-case testing, automated monitoring of import results, additional employee analytics, and more detailed operational reporting.

Documentation Note

The uploaded template is titled 'Full Stack Development with MERN' and asks for React, Node.js/Express.js, MongoDB, npm commands and API documentation. Those sections have been retained as headings but adapted to the actual ServiceNow implementation rather than falsely documenting technologies that are not part of this project.
